

Business Process Automation **Case Study**

Business Intelligence embrace HP's Revenue Cycle

INDUSTRY: MANUFACTURING

90% Faster conversion of raw data into Intelligence Accelerated Decision Making @HP

HP: Moving to Real-time Dashboards from Excel based reporting

HP has tons of raw data about revenue and returns from different branches. These then feed into Excel for each quarter.

It normally takes 15+ days for offshore team analyzes data and generates required reports for each branch and then collective set.

It's not just causing time delay but also come along with human errors.

Due to all reports supplied as Excel files, there is no way to filter data across the year or filter them for other metrics. On top of that, all data is stored in Excel which makes them a high security risk. These files are shared with all decision makers and anyone can easily change raw data which may affect other's decision. Also, restricting visibility to few accounts is next to the impossible task

Any configuration change like changing chart range or chart type or pivot column requires Excel expertise and needs to restore for other users at end of analysis. There is no way each user can have their customization due to a single file.

Solution

AgileCube presented a detailed analysis to have a BI tool with a centralized database with fully dynamic and customizable dashboard and reports along with user restriction on data access. We are able to achieve client's expectation of having all dashboards implemented with 100% data and format matching with Excel.

- 50+ Dashboard from different branch of HP

- Customizable Chart Types

- Create New Dashboards from Data with custom filters.

- Generate Reports based on Historical Data for strategic planning and decision making.

- Options to change real-time metrics for quick decisions.

- Sharing of dashboard and widget helps users to pass required items to their managers or end customer

- Send dashboard and widgets as a body of email or take print of them makes end users life pretty smooth.

- Android Application for Sales Team along with integrated with a geo-location API
